SD Series Offline PC Software

Please note that if you are preparing sessions to run on a console, you should use the same version of "Offline" software that the console is running.

Although there is normally upward version compatibility, there is definitely no guaranteed downward compatibility and therefore using the correct version is advisable.

Many users worldwide regularly use the offline system running on various Mac's, using a Windows emulation program, such as Parallels, Boot Camp etc. which are widely available. Sessions created like this are fine for use on your SD console.

Installation Instructions

The SD Installer program will install the current offline version of your SD series console. If you already have a version of SD Offline software on your PC, this will be placed in a new folder called "Backups" in "C:" partition of your drive labelled with the date and time of the new install.

If it does not already exist, the installer will create a folder called "Projects" in the "C:" partition of your hard drive where your sessions will be saved or loaded from.

If required, an update for Microsoft C++ will also be installed.

1. Run the program "DiGiCo _SDxx_Vxxx_Offline_Installer.exe" . The Welcome screen will appear.

2. Click on "Install". The program will now install the latest version of SDxx on your PC. A Short cut to the SDxx Program will be placed on your Desktop.

3. Once the installation process has completed, click finish.

If you require assistance experience any problems, please contact DiGiCo Support.
